

**CENTRALIZED DISABLEMENT OF INSTRUMENTATION EVENTS
WITHIN A BATCH SIMULATION FARM NETWORK**

5

ABSTRACT OF THE DISCLOSURE

10

A method and system for disabling an instrumentation event in a simulation model within a batch simulation farm in which a simulation client communicates with an instrumentation server to process simulation data with respect to the simulation model. An instrumentation event disable list is assembled within the instrumentation server. The assembly of the event disable list includes identifying an instrumentation event to be disabled during simulation processing of the simulation model, and delivering to the instrumentation server an instrumentation event name corresponding to the instrumentation event to be disabled. Prior to simulating the simulation model within the simulation client, the instrumentation event disable list is retrieved from the instrumentation server, and instrumentation events are disabled as specified within the instrumentation event disable list.
